

MERN STACK DEVELOPMENT

Introduction to Browser & Web – Task 1

3. Difference between HTTP1.1 vs HTTP2

- » HTTP1.1 keeps all requests and responses in plain text format.
- » It has to break and remake the TCP connection with every new request.

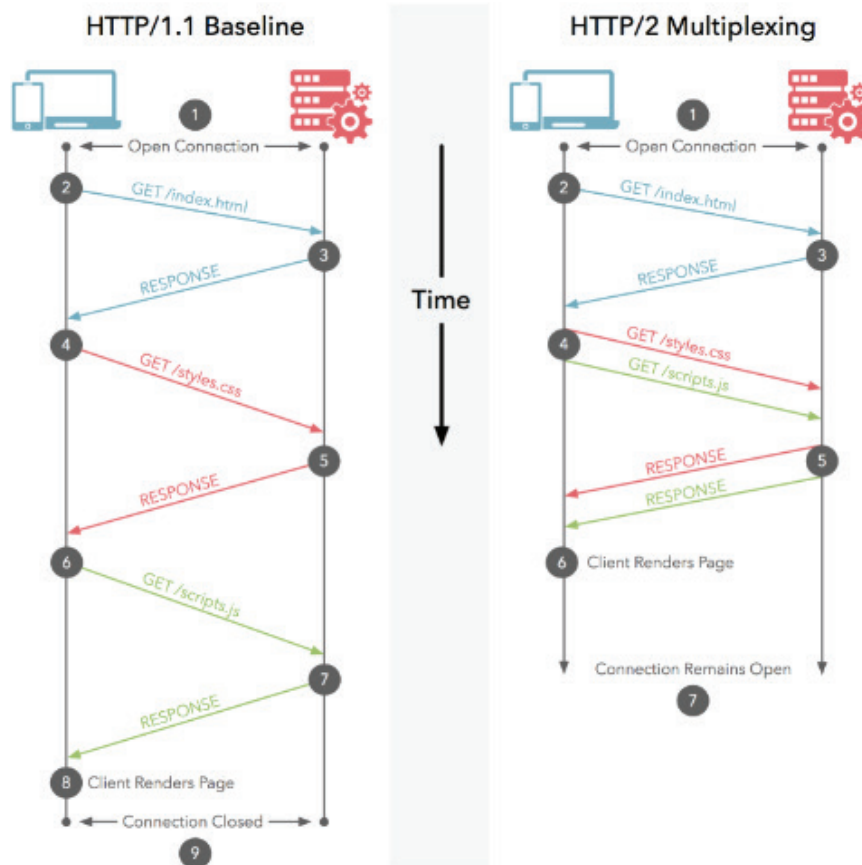

- » HTTP2 uses binary framing layer to sum up all messages in binary format.
- » It sends multiple requests between browsers and servers at the same time over a single TCP connection.

Statically Typed Language = Programming Language
Dynamically Typed Language = Scripting Language

MERN STACK DEVELOPMENT

Introduction to Browser & Web – Task 1

- » HTTP2 uses header compression to reduce overhead.
- » HTTP2 allows servers to 'push' responses instead of waiting for a new request for each resource
- » HTTP2 loads website faster with less optimisation.
